

Robert Kotcher

Y Combinator alumni | Carnegie Mellon graduate | viral app founder | 2 exits

Education

Carnegie Mellon University '12
BXA Computer Science, Arts

AlphaLab Accelerator '12
with Tunessence (acquired)

Projects

Cat-astrophe prevention unit
I built a robot to spray my cat when he gets on the counter.

engineering

Research

Timing attacks using CSS filters
51 citations

engineering

OAuth Demystified for Mobile Application developers
180 citations

engineering

Experience

Python	10 years
Node.js	10 years
CSS	10 years
React.js	10 years
TypeScript	8 years
AWS	8 years
Docker	7 years
Java	6 years
Deep learning	6 years
Kubernetes	3 years

Additional skills: HTML5, full-stack development, back-end web development, software development, microservices.

Professional experience

Founder, engineer @ inflightsimulator.com (August 2026 – present)

Inflight Simulator went viral, reaching 60,000 flights within days of release.

Inflight Simulator lets people explore the world as an airline passenger, choosing destinations and collecting country flags as they complete virtual flights.

Technical skills required included Three.js, Node.js, shadow mapping, geometry reduction, scene culling, frustum streaming, and character rigging.

engineering | product | growth

Founding engineer, pod lead @ solosuit.com (2024 – present)

As a founding engineer at SoloSuit (Y Combinator, W21), I helped build a debt resolution platform serving 200,000+ Americans and protecting $2.7 billion in claimed debt.

I grew SoloSettle's monthly settlement volume 20x in 20 months, leading dozens of A/B tests across the settlement funnel.

I shipped a product experiment that increased the settlement-offer send rate from 8% to 37%.

I lead a pod of 3–6 engineers and own the team's delivery. I build and maintain core features in TypeScript, Ruby on Rails, and PostgreSQL, supporting a 12,000+ spec test suite.

engineering | product | growth

Product R&D @ Codecov (2020 – 2022)

Codecov was acquired by Sentry in 2022. I researched and built new products in JavaScript and Jest that were later handed off to the engineering team. My testing tool was one of the reasons for the acquisition.

engineering | product

Lead Software Engineer @ Synthesis AI (2020 – 2023)

As a founding engineer, I built most of Synthesis AI's data pipelines from the ground up using Go (Golang) and Kubernetes. I maintained AWS infrastructure, Docker containers, and a Go API.

engineering

Software Engineer @ expii.com (2015 – 2017)

I worked on Expii's interactive math and science learning platform, built with a React.js frontend and Python/Flask backend on AWS.

engineering

Software Engineer @ NASA (2013 – 2015)

I developed Java software for an ADS-B sense-and-avoid system that was licensed to Vigilant Aerospace.

engineering

Full Stack Engineer @ Tunessence (April 2012 – June 2014)

I was the first hire at Tunessence, a guitar-teaching startup acquired by music publisher Hal Leonard. I worked across the stack using Python and JavaScript.
